Planning Time Performance Information – Quarter 2 2021/22

Time performance statistics for Quarter 2 (Q2) are provided as an appendix to this Bulletin.

They use the Scottish Government's headline indicators, which measure decision making times by the average number of weeks in which applications without processing agreements or agreed time extensions are determined. The national indicators look at major, local (non-householder) and householder developments. The appended statistics present information on listed building consent and advert applications in a similar way. Enforcement cases are presented using the same indicators as in previous years.

The time performance information for last year (2020/21) uses figures checked by the Scottish Government. The figures for the most recent quarters are interim figures and may not include stop-the-clock periods.

The appended charts show that in Q2:

- Four of the seven major applications determined had processing agreements or agreed extensions of time. The other three resulted in an estimated average decision time of 54.1 weeks, which is longer than the national average. This is due in part to the time taken for legal agreements to be concluded, which is improving but is the subject of further improvement actions.
- Average decision times for local developments (14.2 weeks) were the same as the previous quarter and longer than Council's average for 2020/21 (13.1 weeks) and the national average for 2020/21 (12.4 weeks). This is due to the large volume of cases received in the previous nine months, the impact of the COVID-19 lockdown on staff, and the clearance of long-term legacy cases.
- Average decision times for householder developments (8.3 weeks) were longer than last quarter and the Council's average for 2020/21 (7.6 weeks). A high number of householder applications were received and determined in this quarter.

Contact:

Ben Wilson
Team Manager
ben.wilson@edinburgh.gov.uk

Across all relevant application types, the service determined 975 applications during Q2. This is lower than the previous two quarters but still historically high. Overall, 942 relevant applications were submitted in Q2, a decrease on the previous two quarters but also still a high volume compared to long term trends.

The appended statistics include for the first time information on numbers of applications without processing agreements or agreed extensions which were determined after the statutory point at which an applicant can appeal against non-determination, along with the number of concluded appeals against non-determination. The latter is a comparatively small number, but it is notable that so far 2021/22 has seen more appeals against non-determination conclude than 2020/21 in its entirety.

The appended statistics include, for the first time, information on works to statutorily protected trees. These consist of:

- Applications for work to trees which are subject to a Tree Preservation Order (TPOs); and
- Notices of intent to carry out works to trees in a conservation area (referred to as TCOs).

The statistics show improving average times for TCOs but a significantly longer average time for TPOs. This is due to clearance of case backlog. Process changes are being introduced to assist in clearing old cases and supporting faster times moving forward.

The appendix provides commentary on enforcement and legal agreements and shows that progress has been made in reducing the number of legal agreements which go over six months from the minded to grant stage. A Customer Forum session on legal agreements was held in November 2021 and further improvements are being progressed including the use of a simplified approach for applications involving small sums of developer contributions.

Edinburgh Sustainable Rainwater Management Guidance

Edinburgh Sustainable Rainwater Management Guidance was approved at the Transport and Environment Committee on [14 October 2021](#).

Contact:

Julie Waldron
Senior Planner
Julie.Waldron@edinburgh.gov.uk

The guidance explains one of the objectives in the [Water Management Vision](#) (Bullet point Number 6) and is part of the Edinburgh Design Guidance.

[ESWRMG Main Document V1.pdf](#)

[ESRWMG W1 Trees Factsheet V.1.1.pdf](#)

[ESRWMG W2 Swales Factsheet V.1.pdf](#)

[ESRWMG W1 Rain Garden Factsheet V.1.pdf](#)

The guidance and factsheets apply to planning, permitted development projects including roads and active travel projects, and explain part of the new surface water management policy that is in City Plan 2030.

The use of sustainable drainage in all projects going forward, including retrofit projects, will help the city cope with the changing rainfall patterns and reduce the overall amount of surface water entering into our rivers and streams.

Cycle Parking Factsheet

A cycle parking factsheet has been prepared (Appendix 2). This will accompany the Edinburgh Street Design Guidance which is part of the non-statutory Edinburgh Design Guidance. It is intended that this factsheet will be published on the Council's website before the end of 2021 and it will be a material consideration in the determination of planning applications.

The factsheet contains information on design principles, options for cycle parking used for different durations, and the requirements for cycle parking at different types of development.

Major Developments

Average Decision Times (weeks) for applications without processing agreements or agreed extensions

Sub	32	27	3	5	7	8	2	8		
Det	25	30	5	5	6	6	6	7		
6 month totals:			Sub:8, Det:10			Sub:15, Det:12			Sub:10, Det:13	
12 month totals:			Sub:23, Det:22							
Decided over 16 wks no agreements/extensions										
	2	3	0	0	2	1	3			
Appeals against non determination										
	0	0	0	0	1	0	1			

Comments:

Four out of seven major application decisions had processing agreements

- One at Gogar to form new access road and active travel route (refused)
- Other three include residential/student accommodation/hotel/office and other commercial developments (1 refused, 2 granted)

Remaining three without process agreements include:

- Change to previous consent at Gilmerton with addition of 2 houses
- Residential development at Tower Street
- Mixed use/student accommodation at Baltic Street

Local (Non-Householder)

Average Decision Times (weeks) for applications without processing agreements or agreed extensions

Sub *	1061	1082	184	243	285	295	208	183		
Det*	1082	1000	187	212	244	294	195	161		
6 month totals:			Sub:427, Det:399		Sub:580, Det:538		Sub:395, Det:356			
12 month totals:			Sub:1007, Det:937							
Decided over 8 wks no agreement/extensions										
	101	103	112	126	125	117				
Appeals against non determination										
	1	0	0	0	3	0				

Notes:

- Decision times are from validation to issuing of permission, which includes time for legal agreements to be concluded.
- [Scottish Government](#) headline indicators monitor average decision times for major, local and householder applications without processing agreements or agreed time extensions. The charts show these times for relevant applications
- Quarterly figures for 20/21 are from Scottish Government's checked statistics, and factor in stop-the-clock periods.
- 21/22 Q1 and Q2 figures have not been verified by Scottish Government and may include additional data eg. stop-the-clock periods
- Submitted & determined figures show all applications (i.e. with and without processing agreements / agreed extensions)

* Pre-21/22 numbers for Local (Non-householder) cases also include some non-planning application cases. 21/22 figures exclude these to better reflect Scottish Government statistical method.

Householder

			6 month %: 328 (73.7%)		6 month %:	
			12 month %: (20/21 : 61.5%)			
Number of notices served			3	0		
Number (and %) closed within 6 months (target 80%)			1 (33.3%)	n/a		
			6 month %: (20/21: n/a)		6 month %: (20/21: n/a)	
			12 month %:- (20/21 : n/a%)			

The service has continued to use discretionary enforcement powers, to support business recovery in response to Covid-19 where this is appropriate. New STL cases have fallen since Q1 due to ongoing lockdown restrictions but the service has continued to pursue formal action.

Short and Long Stay Cycle Parking – Design Principles

This sheet provides general design principles for providing short and long stay cycle parking in both existing streets (retro-fitting) and new developments. It should be used as an accompanying sheet for providing cycle parking of all types elsewhere in this factsheet.

Short Stay Cycle Parking

Should be provided for **visitors** to key destinations such as shops, community centres, museums, libraries, health centres and parks.

To be effective, short stay cycle parking should:

- ❑ Be near destination entrances and more convenient than nearby car parking spaces.
- ❑ Directly link to cycle routes and be provided on cycle desire lines.
- ❑ Be sited on a well-drained surface, overlooked and lit.
- ❑ Be easily accessible with a short route from the street with no steps and any doors easy to negotiate.
- ❑ Be easy to use (no lifting or dragging needed) and allow at least one wheel and frame to be locked.
- ❑ Not present an obstruction to mobility or visually impaired users and be suitable for their use.
- ❑ Not block or obstruct pedestrian movements and desire lines and vehicle access.
- ❑ Accommodate non-standard bicycles with a variety of locking points to support different bicycle types (preferably 20% of spaces).
- ❑ Minimise visual impact on surroundings and be well integrated with the public realm, especially in **conservation areas** and the **World Heritage Site**.
- ❑ Provide facilities for electric bicycle charging.

Long Stay Cycle Parking

Should be provided for **residents** at homes; **employees** at workplaces; **students** at educational institutions and **passengers** at transport interchanges.

To be effective, long stay cycle parking should:

- ❑ Include the principles set out for short stay parking.
- ❑ Be secure (access controlled) and weather protected (covered).

Additional Principles for New Developments

To be effective, cycle parking should:

- ❑ Include the principles set out for short stay and long stay parking.
- ❑ Be future-proofed. Locations chosen should have capacity to increase amount of cycle parking as demand increases.
- ❑ Accommodate non-standard bicycles (minimum 20% of all spaces; preferably higher).

Short stay cycle parking on footway within building curtilage – Sheffield stands in echelon

Cycle Parking Options for Short Stay

This sheet provides an overview of the short stay cycle parking options suitable for different locations, both for retro-fitting cycle parking on existing streets and for cycle parking in new developments.

Details of the cycle parking types are provided on the subsequent pages. The table is not exhaustive, with different options than those identified in this table potentially more appropriate depending on the situation.

Short stay cycle parking		
Location	Preference	Type of cycle parking preferred
On carriageway (incl. build outs)	Preferred if space within building curtilage not available	Retro-fitting <ul style="list-style-type: none"> • Sheffield stands [pg 23-25] • Portable rack units for temporary use for assessing demand [pg 33]
		New developments <ul style="list-style-type: none"> • Sheffield stands with protection islands, trees or planters [pg 23-25]
On footway	Retro-fitting Not preferred If used, minimum footway widths shall be maintained	<ul style="list-style-type: none"> • Sheffield stands [pg 23-25]
	New developments Not permitted unless located on a purpose built footway extension or kept within the furniture zone	
Off-street	Preferred for new developments and large premises with external space within curtilage e.g. schools, health centres, supermarkets and large employers	<ul style="list-style-type: none"> • Sheffield stands (preferably covered) [pg 23-25] • Standalone storage units [pg 28-29]

Cycle Parking Options for Long Stay

This sheet provides an overview of the long stay cycle parking options suitable for different locations, both for retro-fitting cycle parking on existing streets and for cycle parking in new developments.

Details of the cycle parking types are provided on the subsequent pages. The table is not exhaustive, with different options than those identified in this table potentially more appropriate depending on the situation.

Long stay cycle parking		
Location	Preference	Type of cycle parking preferred
On carriageway (incl. build outs)	Not preferred, but acceptable if off-street space unavailable	• Hinge top units [pg 26-27]
	New developments Not permitted *	
On footway	Retro-fitting Not preferred Only allowed where there is an existing footway build-out or a new footway extension is built to accommodate it	• Hinge top units [pg 26-27]
	New developments Not permitted *	
Off-street	Retro-fitting Most preferred	Retro-fitting • Hinge top units [pg 26-27] • Standalone storage units [pg 28-29] • Two tier storage where space is constrained [pg 32]
	New developments Required [pg 13-22]	New developments • Garages [pg 30] • Standalone storage units [pg 28-29] • Storage cages [pg 31] • Two tier storage where space is constrained [pg 32]

The City of Edinburgh Council

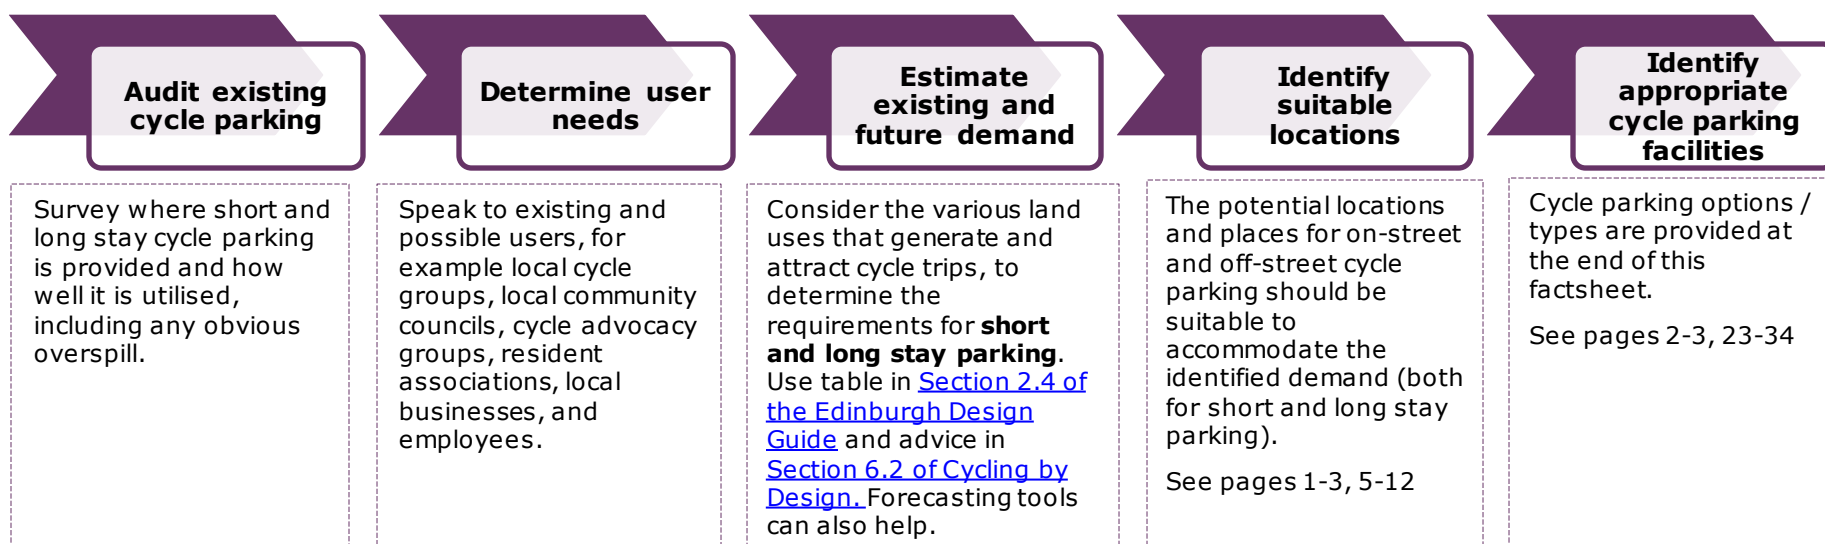

The City of Edinburgh Council

* Long-term cycle parking for new developments cannot be met on existing or new streets. In exceptional circumstances where it is impossible to provide cycle parking in the new development the Council may seek a contribution towards a public secure cycle parking hangar.

Retro-fitting Cycle Parking

It is essential to provide appropriate and attractive cycle parking at key origins and destinations to encourage cycling as a means of transport, to show non-cyclists that it is a viable option and that cyclists are welcomed.

The flow chart below summarises the overall process to assess the need for and retro-fit cycle parking in various street types and land uses (trip generators and attractors). When installing new cycle parking in a street, any existing cycle parking that does not fit with the current guidance should be improved.

Guidance is provided in the form of illustrative examples for identifying suitable locations for the following street types and uses:

- High streets – including town centres and neighbourhood shopping streets
- Residential streets – in high and medium density residential areas
- Employment streets and workplaces – including industrial areas
- Community destinations – including libraries, museums, GP surgeries, sports centres, parks etc.
- Educational institutions – including nurseries, primary and high schools, higher education etc.

Cycle Parking on Carriageway (incl. new build outs) – Design Principles

Table below should be used in conjunction with the design principles on page 1 of this factsheet. TRO and/or Redetermination Orders will be required for locating cycle parking on carriageway or new build outs.

Considerations	Short Stay <i>Sheffield stands; Portable rack units;</i>	Long Stay <i>Hinge top units</i>
How many spaces per individual location?	2-20 spaces per location At least 20% of cycle parking spaces should be able to accommodate non-standard cycles, particularly where 10 or more spaces are provided. For information on non-standard bikes see https://wheelsforwellbeing.org.uk/	Depends on demand assessment (see page 4 for advice)
How many locations per length of street?	Shopping streets – every 100-150m Other streets – adjacent to demand generators (schools, libraries, community centres, major employers, major shops, corner shops), but only where cycle parking cannot be accommodated within the curtilage	Every 150-200m in areas with identified level of general demand. Otherwise, adjacent to specific building(s) where demand has been identified, but only where cycle parking cannot be accommodated within the curtilage
Where to site?	As close as possible to junctions and crossings for accessibility, whilst maintaining visibilities and safe distances required by the ESDG (see G6 and G4 factsheets) and/or Traffic Sign Manual Chapter 6 In converted car parking spaces on streets where car parking is permitted at all times In “lee” (shelter) of existing footway build outs and within new purpose built footway build outs.	
Where not to site?	Within intervisibility zones at junctions or within controlled area of crossings (as required by G6 and G4 factsheets and/or Traffic Sign Manual Chapter 6) Within ‘Bus Box’ area at bus stops and bus boarders (see PT2 factsheet) to avoid obstructing access or egress onto buses Where likely to impact on Public Transport, particularly in bus lanes (see PT3 factsheet) On utility access points On pedestrian desire lines and crossings At waste and recycling collection access points Streets with 30 mph speed limit or above (except within footway build out) At a location where the first logical move away from the parking is along the tram tracks	
How to make sure access/egress is safe and convenient?	Site adjacent to a kerb

Cycle Parking on Footways (incl. existing build outs)– Design Principles

Table below should be used in conjunction with the design principles on page 1 of this factsheet.

Considerations	Short Stay <i>Sheffield stands</i>	Long Stay <i>Hinge top units</i>
How many spaces per individual location?	2-10 spaces per location Depends on demand assessment (see page 4 for advice) Where possible, 20% of cycle parking spaces should be able to accommodate non-standard cycles, particularly where 10 or more spaces are provided. For information on non-standard bikes see https://wheelsforwellbeing.org.uk/	Not preferred Should only be used where there is an existing footway build-out or a new footway extension is built to accommodate it
How many locations per length of street?	On shopping streets – every 100-150m Other streets – adjacent to demand generators (schools, libraries, community centres, major employers, major shops, corner shops) but only where cycle parking cannot be accommodated within the curtilage	
Where to site?	Footways, provided clear effective footway widths can be maintained As close as possible to junctions and crossings for accessibility, whilst maintaining visibilities and safe distances required by the ESDG (G6 and G4 factsheets) and/or Traffic Sign Manual Chapter 6 Aligned with existing street furniture, particularly in “lee” (“shelter”) of large elements of street furniture such as phone and utility boxes, fixed litter bins, and downstream of bus shelters Existing build outs can provide good locations where sufficient/clear space is available.	
Where not to site?	Where an effective clear footway width for the street type cannot be maintained Out of alignment with existing street furniture On pedestrian desire lines and crossings (or within 3m of dropped kerb or tactile paving, at the closest point) At bus stops, to avoid obstructing passenger access or egress On utility access points Within visibility splays at junctions Where seasonal temporary street furniture is located, e.g. dining facilities outside cafés At waste and recycling units access points Near loading spaces to avoid conflict with vehicle door openings and blocking access points for goods vehicles At a location where the first logical move away from the parking is along the tram tracks

Cycle Parking Off-Street – Design Principles

Table below should be used in conjunction with the design principles on page 1 of this factsheet.

Considerations	Short Stay <i>Sheffield stands (preferably covered);</i>	Long Stay <i>Hinge top units; Standalone storage units; Two tier storage (in constrained areas only)</i>
How many spaces per individual location?	Depends on demand assessment (see page 4 for advice) but for retail a minimum of 1 customer and 1 employee space should be provided At least 20% of cycle parking spaces should be able to accommodate non-standard cycles, particularly where 10 or more spaces are provided. For information on non-standard bikes see https://wheelsforwellbeing.org.uk/ .	
How many locations per length of street?	At every trip generator (schools, libraries, community centres, major employers, major shops, corner shops), located within the building curtilage	
	As close as possible to main entrance to premises, where provision for cycle parking within building curtilage is not possible	
Where to site?	Within the curtilage of premises (communal areas) In car parking places Near entrances, and be more convenient than nearby car parking spaces Overlooked and lit places and preferably covered by the premises CCTV if available Visual impact of facility should be considered and minimised	
		Secure places where access can be controlled for security purposes (e.g. through issuing keys, passes or codes)
Where not to site?	Places that require lifting or dragging of bikes to access On pedestrian desire lines and crossings On utility access points At waste and recycling units access points Near loading spaces to avoid conflict with vehicle door openings and blocking access points for goods vehicles At a location where the first logical move away from the parking is along the tram tracks

Cycle Parking in New Developments

Cycle parking forms an integral part of any planning application. This should include details of where the cycle parking will be located, type of parking, purpose (short or long term), number of spaces and access considerations.

Cycle parking in new developments, including those altering existing buildings or spaces, should meet the appropriate **cycle parking standards in [Edinburgh Design Guidance Section 2.4](#)** and guidance set out in this factsheet.

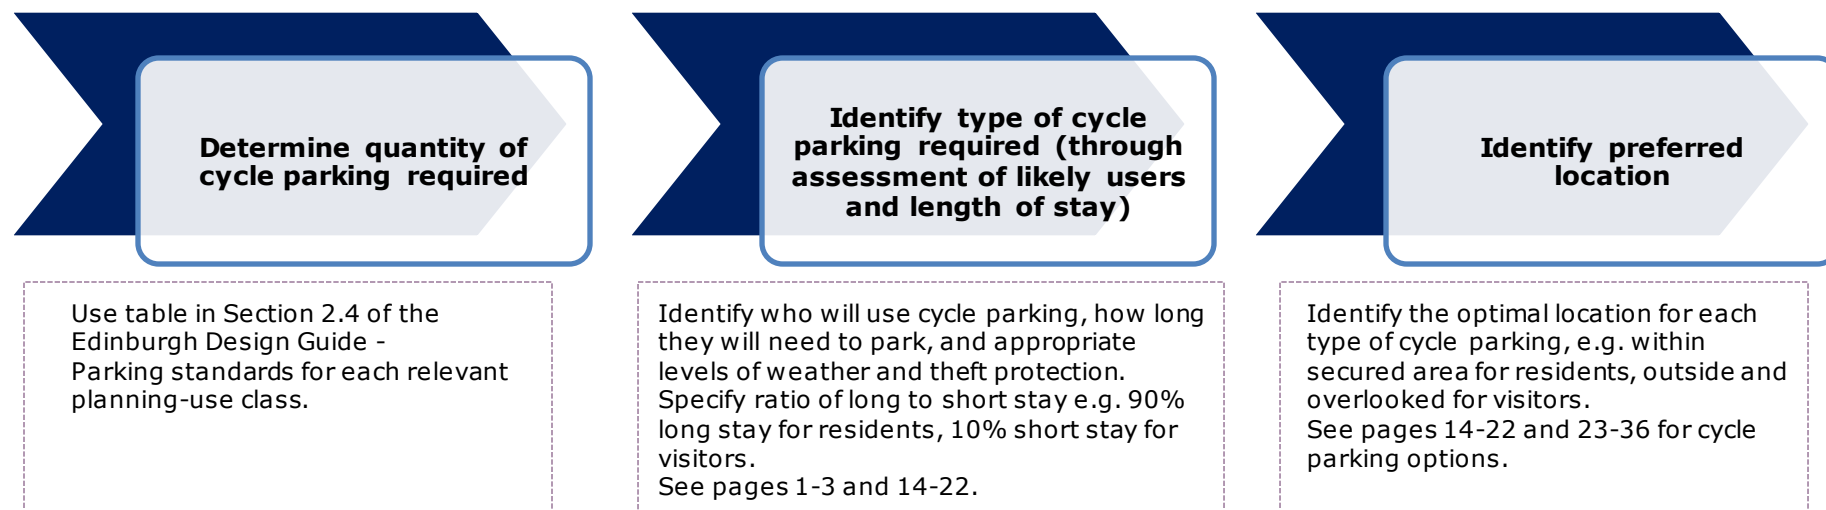

Cycle parking should be considered at the Masterplan stage and major developments should submit a transport assessment and travel plan, detailing required off-street long term parking facilities as well as on-street short term visitor parking. It should accommodate any target levels of cycling and have scope to increase provision if necessary.

The assessment of cycle parking numbers should take into account the location and nature of the development, the ease of reaching it by cycle, including the planned future network and the Council's targets for increasing cycle use.

The flow chart below summarises the overall process to assess the need for cycle parking in various new development types and land uses. Individual pages provide specific advice and design principles for each new development type.

When considering cycle parking for new developments, it is important to assess and understand the implications for mobility impaired and visually impaired users in terms of:

- Placement of facilities in public areas which may cause an obstruction or hazard
- Access to/from facilities for those who may be using adapted bikes

Relevant Factsheets:

Designing for Cycling (C1)
Footway Widths (P3)
Street Furniture (F1)

Pedestrian Desire Lines (P2)
Footway Zones(P3)
Reduced Clear Kerb Zone (F1)

Designing Inclusive Streets (P2)
De-cluttering Assessment (P7)

Residential Cycle Parking for Flats

Cycle parking should be provided for:

- Residents for long stay
- Visitors for short stay

Long stay for residents

All residents should have access to secure **long stay cycle parking** (access restricted, only for residents issued with keys, passes or codes). It should meet the appropriate cycle parking standards in [Edinburgh Design Guidance Section 2.4](#) and the design principles set out for short and long stay parking on pages 1-3 of this factsheet.

Options in order of preference:

- Level accessed, fully enclosed, weather-protected communal parking within the building in secure parking area (residents' access only) at ground level. This is only acceptable above or below ground level if there is a cycle friendly lift provided.
- Cycle stores, accommodated within the footprint of the new development and directly accessed from street and/or dedicated active travel infrastructure.

- Cycle parking within secure car parks is acceptable, if suitable dedicated cycle access and egress provision is made. It should be on the ground floor (or the floor where you enter the car park) and near the lifts and stairs. Cycle users should be able to trigger any car parking barrier, or a gap of at least 1.5m to the side of the barrier is provided. Any ramps should be a maximum of 5% gradient.

Electric bicycle charging should be available in the main cycle parking area.

For larger developments, a combination of cycle-parking options and locations which support different bicycle types will be required. A maximum of 80% of all cycle parking spaces can be one type. At least 20% of cycle parking shall be suitable for use by non-standard bicycles (such as adapted bikes, tandems, cargo bikes and bike trailers).

How bike security, assess control and its maintenance will be sustained over the years should be addressed in a long-term site management plan/proposals.

Short stay for visitors

Short stay cycle parking should be provided in addition to secure access restricted long stay cycle parking, and never as a replacement. As well as visitors, lower security cycle parking often proves popular with residents, for example for short stops at home or for new residents that have not yet gained access to the secure cycle parking area.

Short stay cycle parking should be:

- Sheffield stands (see pg 23-25) or similar, located within the development
- Within 25m of the main building entrance for flats
- Overlooked by nearby buildings for natural surveillance
- Preferably weather protected (covered)

Visitor cycle parking may be provided in access free ground level car parking areas, on-carriageway, but not on footways unless located on a purpose build footway extension or between a furniture or planting zone.

The need to lift and drag; negotiate steps; long convoluted routes between bike stores and the street; and doors that are difficult to open when wheeling a bike must be avoided.

Residential Cycle Parking for Houses

Cycle parking should be provided for:

- Residents for long stay
- Visitors for short stay

Long stay for residents

All residents should have access to **secure long stay cycle parking**.

Cycle parking should meet the appropriate cycle parking standards in [Edinburgh Design Guidance Section 2.4](#) and the design principles set out for short and long stay parking on pages 1-3 of this factsheet.

When a house has a garage, this should accommodate cycle parking area (see pg 30 for details).

Otherwise, cycle parking may be provided in externally accessed private rear gardens.

Short stay for visitors

Short stay cycle parking

should be provided in addition to secure access restricted long stay cycle parking, and never as a replacement. Short stay parking may be used by visitors or for cycle-based deliveries.

Short stay cycle parking should be:

- Sheffield stands (see pg 23-25), located within the development
- Overlooked by nearby buildings for natural surveillance
- Preferably weather protected (covered)

Visitor cycle parking may be provided in access free ground level car parking areas, on-carriageway, but not on footways unless located on a purpose build footway extension or between a furniture or planting zone.

Cycle parking on footway for visitors outside terraced houses in the furniture zone

Street Furniture (F1)

Pedestrian Desire Lines (P2)
Footway Zones (P3)
Reduced Clear Kerb Zone (F1)

Designing Inclusive Streets (P2)
De-cluttering Assessment (P7)

Educational Institutions

Cycle parking should be provided for:

- Students and staff for long stay
- Visitors and parents for short stay

All students and staff should have access to secure long stay cycle parking.

Short stay parking should be provided for parents, visitors and students.

Cycle parking should meet the appropriate cycle parking standards in [Edinburgh Design Guidance Section 2.4](#) and the design principles set out for short and long stay parking on pages 1-3 of this factsheet.

Scoter stands within bike parking area

The City of Edinburgh Council

Pupils / Students

All pupils should have access to **weather protected cycle parking**, located within the school, college or university premises.

For nursery and primary school pupils:

- Sheffield stands should include a bar at 0.4m above ground to allow for small bicycles
- Scooter stands should be provided alongside bike stands
- Location determined to maximise personal safety with natural surveillance

For secondary and further education students:

- 75% of cycle parking should be easy access (no key, pass or code needed to enter) with natural surveillance and preferably CCTV
- 25% of cycle parking should be security controlled (key, pass or code needed to enter), preferably a mixture of parking types (see pg 23-34 for options)
- Located within 50m of entrance to school/college building

Staff

Members of staff should have access to long stay secure cycle parking.

Cycle parking should be:

- Access-restricted (key, pass or code needed to enter)
- Weather protected – essential
- Within 50m of workplace entrance
- On the same floor as workplace entrance, or with cycle-friendly lift provided if above or below ground floor
- Located close to any changing / shower facilities

The parking type provided is dependent on demand.

Visitors

Visitors do not include pupils but may include parents dropping off children.

Cycle parking should be:

- Within 25m of main entrance to school, college or university
- Preferably covered (weather protected)
- Overlooked with natural surveillance, and/or with CCTV

Visitors cycle parking may be provided in access free ground level car parking areas, on-carriageway, but not on footways unless located on a purpose built footway extension or between a furniture or planting zone.

Street Furniture (F1)

Pedestrian Desire Lines (P2)
Footway Zones(P3)
Reduced Clear Kerb Zone (F1)

Designing Inclusive Streets (P2)
De-cluttering Assessment (P7)

Retail Establishments

Cycle parking should be provided for:

- Visitors (shoppers and deliveries) for short stay
- Employees for long stay

Cycle parking should meet the appropriate cycle parking standards in [Edinburgh Design Guidance Section 2.4](#) and the design principles set out for short and long stay parking on pages 1-3 of this factsheet.

Cycle parking outside shopping centre access provides good natural surveillance and minimal diversion from desire lines

Atkins

Visitors

Cycle parking at **high streets, large shopping precincts and shopping centres** should be:

- Cycle stands located within 25m of shopping area, near entrances
- Weather protected - essential
- Overlooked with natural surveillance, and/or with CCTV

Cycle parking may be provided within multi-storey car parks if suitable access and egress provision is made. This should be on the ground floor (or the floor where you enter the car park). Cycle users should be able to trigger any car parking barrier, or a gap of at least 1.5m to the side of the barrier is provided. Any ramps should be a maximum of 5% gradient. Passing motorists should be alerted to the availability of free cycle parking to encourage a mode switch.

Cycle parking at **individual shops and small shopping precincts** should be:

- Located within 15m of shop entrance
- Provided as small clusters of stands rather than one big group
- Preferably weather protected
- Overlooked with natural surveillance, and/or with CCTV

Two tier racks should not be used at retail establishments as most visitors tend to only park for a short amount of time, and two tier racks may discourage users as they are inconvenient.

Cargo Bikes

At retail outlets, there is the potential for a large number of cargo bikes undertaking deliveries. Therefore, new retail establishments should provide a greater amount of non-standard cycle spaces than the minimum 20% suggested. Cycle parking for delivery bikes should be located conveniently, depending on the loading / unloading requirements.

Employees

All employees should have access to **secure cycle parking**. This should be:

- Access-restricted (key, pass or code needed to access)
- Weather protected - essential
- Within 50m of workplace entrance
- On same floor as workplace entrance, or with cycle-friendly lift if within building
- Located close to any changing / shower facilities

Cycle parking on ground floor of car park provides weather protection and natural surveillance

Atkins

It is essential that car parking does not impact on cycle parking and there is sufficient space to manoeuvre a bike.

Relevant Factsheets:

Key Parameters (C1)
Footway Widths (P3)
Street Furniture (F1)

Pedestrian Desire Lines (P2)
Footway Zones (P3)
Reduced Clear Kerb Zone (F1)

Designing Inclusive Streets (P2)
De-cluttering Assessment (P7)
Visibility (G6)

Workplaces

Cycle parking should be provided for:

- Employees for long stay
- Visitors for short stay

Cycle parking should meet the appropriate cycle parking standards in [Edinburgh Design Guidance Section 2.4](#) and the design principles set out for short and long stay parking on pages 1-3 of this factsheet.

Dedicated, secure site entrance (from public highway) for cycle commuters

Atkins

Employees

All employees should have access to **secure cycle parking**. This should be:

- Access-restricted (key, pass or code needed to enter)
- Weather protected - essential
- Preferably internal, directly connected to workplace; or, located within 50m of workplace entrance with onward route to entrance under cover, lit and feel safe to use after dark
- On same floor as workplace entrance or with cycle-friendly lift, if within building
- Located close to any changing / shower facilities

Workplaces that attract shift work may have a particularly high demand for cycle parking with employees arriving and leaving at times when public transport is scarce.

Employees should be able to cycle as close as possible to the cycle parking e.g. through the use of dropped kerbs and dedicated cycling facilities. 'Cyclists dismount' signs should be avoided.

Relevant Factsheets:

Key Parameters (C1)
Footway Widths (P3)
Street Furniture (F1)

Pedestrian Desire Lines (P2)
Footway Zones (P3)
Minimum Kerb Zone (F1)

They should have access to e-bike charging facilities.

Cycle parking may be located in a secure car park if cycle users can trigger the barrier or a gap of at least 1.5m to the side of the barrier is provided. This should be on the ground floor (or the floor where you enter the car park). Ramps should be within acceptable gradients (a max. 5%).

Secure parking for both cycles and cars provided by the use of two gates

Cambridge Council

Visitors

Cycle parking for visitors to workplaces should be:

- Located within 25m of workplace main entrance
- Weather protected - desirable
- Overlooked with natural surveillance, and/or with CCTV

Visitors cycle parking may be provided in access free ground level car parking areas, on-carriageway, but not on footways unless located on a purpose built footway extension or between a furniture or planting zone.

Access-controlled and weather protected stand-alone storage unit immediately outside main workplace entrance

Atkins

Designing Inclusive Streets (P2)
De-cluttering Assessment (P7)

Health-Related Destinations

Cycle parking should be provided for:

- Employees and patients for long stay
- Visitors and day care patients for short stay

Cycle parking should meet the appropriate cycle parking standards in [Edinburgh Design Guidance Section 2.4](#) and the design principles set out for short and long stay parking on pages 1-3 of this factsheet.

Employees (at all types of facility)

All employees should have access to **secure cycle parking**. This should be:

- Access-restricted (key, pass or code needed to access)
- Weather protected - essential
- Located within 50m of workplace entrance
- On same floor as workplace entrance or with cycle-friendly lift, if within building
- Located close to any changing / shower facilities

Cycle parking may be located in a secure car park if cycle users can trigger the barrier or a gap of at least 1.5m to the side of the barrier is provided. This should be on the ground floor (or the floor where you enter the car park). Ramps should be within acceptable gradients (a max. 5%).

Patients and Visitors to Hospitals

Cycle parking should be:

- Located within 50m of main entrance (25m for health centres and GP clinics)
- Weather protected (not all needs to be, but essential that at least some covered spaces for long stay are provided)
- Overlooked with natural surveillance, and/or with CCTV

Visitors cycle parking may be provided in access free ground level car parking areas, on-carriageway, but not on footways unless located on a purpose build footway extension or between a furniture or planting zone.

Mixture of weather protected and open cycle parking for short and long stay cycle parking

Atkins

Off-street units (eg located in car parks) should be weather protected. For better protection and natural surveillance, three sides should be enclosed with transparent material.

Relevant Factsheets:

Key Parameters (C1)
Footway Widths (P3)
Street Furniture (F1)

Pedestrian Desire Lines (P2)
Footway Zones (P3)
Minimum Kerb Zone (F1)

Designing Inclusive Streets (P2)
De-cluttering Assessment (P7)

Community Destinations

Cycle parking should be provided for:

- Short stay for visitors of community destinations such as libraries, museums, sports centres, parks etc.
- Long stay for employees and visitors

This should meet the appropriate cycle parking standards in [Edinburgh Design Guidance Section 2.4](#) and the design principles set out for short and long stay parking on pages 1-3 of this factsheet.

A cluster of stands beside tennis courts – sufficient provision for shorter stays

The City of Edinburgh Council

Employees

All employees should have access to **secure cycle parking**. This should be:

- Access-restricted (key, pass or code needed to access)
- Weather protected - essential
- Located within 50m of workplace entrance
- On same floor as workplace entrance or with cycle-friendly lift, if within building
- Located close to any changing / shower facilities

Cycle parking may be located in a secure car park if cycle users can trigger the barrier or a gap of at least 1.5m to the side of the barrier is provided. This should be on the ground floor (or the floor where you enter the car park). Ramps should be within acceptable gradients (a max. 5%).

Visitors – Long Stay (over an hour)

Cycle parking for long stay visitors should be:

- Located within 50m of workplace main entrance
- Weather protected - essential

Overlooked with natural surveillance, and/or with CCTV

Visitors cycle parking may be provided in access free ground level car parking areas, on-carriageway, but not on footways unless located on a purpose build footway extension or between a furniture or planting zone.

At large sites, e.g. parks, minimum 20 stands should be scattered around the area if cycling is permitted throughout, or concentrated at points where cycle routes end.

People often travel to parks by bike, and then go for a walk or a run once they've arrived. Sheffield stands at entry points help to facilitate these trips.

Visitors – Short Stay (up to 1 hour)

Cycle parking for short stay visitors should be:

- Located within 25m of workplace main entrance
- Preferably weather protected

Relevant Factsheets:

Key Parameters (C1)
Footway Widths (P3)
Street Furniture (F1)

Pedestrian Desire Lines (P2)
Footway Zones (P3)
Minimum Kerb Zone (F1)

Designing Inclusive Streets (P2)
De-cluttering Assessment (P7)

Tourist Accommodation

Cycle parking for tourist accommodation sites should be provided for:

- Visitors and employees for long stay

Tourist accommodation sites includes (but is not limited to) hotels, guesthouses, hostels and camp sites.

Cycle parking should meet the appropriate cycle parking standards in [Edinburgh Design Guidance Section 2.4](#) and the design principles set out for short and long stay parking on pages 1-3 of this factsheet.

Employees

All employees should have access to **secure cycle parking**. This should be:

- Access-restricted (key, pass or code needed to access)
- Weather protected - essential
- Located within 50m of workplace entrance
- On same floor as main entrance or with cycle-friendly lift, if within building
- Located close to any changing / shower facilities

Cycle parking will be particularly appreciated by shift workers for whom public transport may not be available when shifts start/finish late at night or early in the morning.

Visitors (long stay – overnight)

Accommodation premises should provide access to **secure cycle parking** for visitors staying overnight. This should be:

- Access-restricted (key, pass or code needed to access)
- Weather protected - essential
- Located within 50m of workplace entrance
- On same floor as the main entrance or with cycle-friendly lift, if within building

Visitors may arrive at accommodation in the evening. Ensure that cycle parking feels safe to access in hours of darkness.

Cycle parking for employees and visitors may be located in a secure car park if cycle users can trigger the barrier or a gap of at least 1.5m to the side of the barrier is provided. This should be on the ground floor (or the floor where you enter the car park). Ramps should be within acceptable gradients (a max. 5%).

Relevant Factsheets:

Pedestrian Desire Lines (P2)
Footway Zones (P3)
Minimum Kerb Zone (F1)

Designing Inclusive Streets (P2)
De-cluttering Assessment (P7)

Cycle Parking at Public Transport Stations and Stops

Cycle parking should be provided for:

- Public transport users and employees for long stay
- Public transport users and visitors for short stay

Cycle parking should meet the appropriate cycle parking standards in [Edinburgh Design Guidance Section 2.4](#) and the design principles set out for short and long stay parking on pages 1-3 of this factsheet.

Cycle Parking at Bus Stops

Cycle parking at bus stops should be:

- Located within 25m of bus stop and on the same side of the road as the stop it is serving
- Preferably weather protected
- Overlooked with natural surveillance, and/or with CCTV

Atkins

Cycle Parking at Tram Stops

Cycle parking at tram stops should be:

- Located within 25m of tram stop and preferably on both sides of tram tracks not in the middle island platform
- Preferably weather protected
- Overlooked with natural surveillance, and/or with CCTV
- Designed so that the most logical move away from the cycle parking is not along the tram tracks

Atkins

Cycle Parking at Railway Stations and Bus Stations

Cycle parking at railway stations and bus stations should be:

- Located within 50m of main station entrance
- Overlooked with natural surveillance, and/or with CCTV
- Weather protected (not all needs to be, but essential that at least some covered spaces for long stay are provided)

At new bus or train stations with ticket barriers, a combination of short-stay easy-access parking (e.g. at the station entrance) and longer-stay more protected parking (platform side of ticket barriers) is ideal.

Two tier storage parking (see pg 32) may be used in combination with other parking option, to a total of 50% of all cycle parking spaces. Two tier parking is efficient where space is limited, however may discourage some cycle users.

Relevant Factsheets:

Key Parameters (C1)

Sheffield Stands

Cycle stands on carriageway

Barcelona, Nazan Kocak

Sheffield stands on footway
(parallel)

The City of Edinburgh Council

Custom (long) Sheffield stand for
non-standard bikes

The City of Edinburgh Council

Key requirements and considerations

- Preferred location is on carriageway. Can also be located footway, but only where clear minimum footway widths are maintained (see overleaf), and off-street locations when covered.
- Made from brushed stainless steel or match the street furniture standards.
- Can be installed perpendicular, in echelon or in parallel, but should be oriented at right angles to any slopes.
- Stands on carriageway should have a bollard at both ends of the stand run to protect parked cycles from cars.
- Should contain reflecting banding and tapping rail to assist visually impaired people (at the end a perpendicular run, or on all if echelon/parallel).
- Should be an integral part of the footway or carriageway. Fixings should be a cored fixing into the footway/carriageway (see pg 25 for exceptions).
- On footways, should be placed in 'furniture zone' adjacent to the kerb. Occasionally they can be located at the back of the footway in "lee" of existing street furniture to avoid street clutter.
- Should not block pedestrian crossing or dropped kerbs, especially when provided parallel to kerb.
- Parallel stands could be used where recommended footway width cannot be maintained with perpendicular or echelon orientation.
- Parallel siting can replace the function of pedestrian guardrail in some places (except at school entrances). Consult **P5 Pedestrian Guardrail factsheet** before replacing any guardrail with stands.
- Visual impact can be reduced if placed between other items of street furniture, especially tree planting within an organised street furniture zone on-footway.
- Off-street units (eg located in car parks) should be weather protected (covered). For better protection and natural surveillance, three sides should be enclosed with transparent material. These units will have larger footprints.

Benefits

- Can be installed as a run with as many or as few stands as required at the location.
- End stand of the run can accommodate non-standard cycles.
- Can be oriented to suit location, space availability and street layout.
- Crossbar provided for smaller cycles.

Drawbacks

- When installed on carriageway, a TRO may be required as well as consultation with stakeholders.
- Can increase street clutter if installed inappropriately on footways.

Suitable for

Short stay parking:

- On carriageway
- On footway
- Off-street

Long stay parking when used with covers and secured entry

Residential areas

Non-residential areas

Sheffield Stands – Layout Options

In carriageway – perpendicular stands with bollards at each end of the run

London Cycle Design Standards, 2016 (Edited)

Stands can be located on wider footways on new development streets in the furniture zone without compromising the minimum desired footway widths (see P3 Footways).

London Cycle Design Standards, 2016 (Edited)

London Cycle Design Standards, 2016 (Edited)

London Cycle Design Standards, 2016 (Edited)

When located on footways, **minimum clear footway width** should be **3m** on high streets, neighbourhood shopping streets and strategic streets; **2.5m** on employment streets, high density residential streets and secondary streets; and **2m** on other streets.

Where more than 2 units of longer Sheffield stands for non-standard bikes are present (see next page for details), minimum clear footway space should be measured from those stands.

Relevant Factsheets:

Key Parameters (C1)

Footways (P3)

Street Furniture (F1)

Pedestrian Desire Lines (P2)

De-cluttering Assessment (P7)

Reduced Clear Kerb Zone (F1)

Designing Inclusive Streets (P2)

Pedestrian Guardrail (P5)

Visibility (G6)

Stands should **preferably** be located on carriageway (perpendicular or echelon), with bollards at both ends of the run of stands.

Stands should be oriented at right angles to any slopes

Sheffield Stands – Construction Details and Fixings

Standard Sheffield stands with a tapping rail should be built to the dimensions specified in the drawing to the right. For Sheffield stands designed for use by longer, non-standard cycles, the length of the stand should be increased to 1.5m.

Stand shall be fabricated from Grade 304 dull polished stainless steel or from mild steel, galvanized to BS EN ISO 1461:2009.

All joints shall be continuously welded with a minimum throat thickness of 5mm.

To assist visually impaired people, stands should have 150mm wide contrasting colour banding, used on TRANSPORT SS bollards by Furnitubes or similar approved.

It is preferred that stands are installed using a core fixing (1).

Retention sockets (2) are most appropriate for locations where cycle parking is temporary or seasonal, or where the cycle parking may need to be removed to allow street activities.

Foundations (1,2) shall be 150mm Ø Arcon Ultracrete Post Fix or similar approved.

Surface fixing (3) is permissible only in exceptional circumstances where utilities in the ground do not allow core fixing or retention sockets.

Hinge Top Units

The City of Edinburgh Council

Dimensions of a standard hinge top unit

Key requirements and considerations

- For hinge-top units retrofitted into the street, agreement in advance must be made with the Active Travel team. All Council-installed hinge-top units must be part of the Council's ongoing contract for the maintenance and running of secure on-street cycle parking hangars.
- Employers may retrofit hinge-top units into their private car parks (not onto public carriageway) but will be responsible for managing these units, not CEC.
- A standard unit fits 6 bicycles and it preferred that two units are provided at each location facing each other 'hub-style', as long as a 2 metre gap between units can be provided. See next page for standard layout.
- Where clear footway width for the street type can be maintained (see overleaf), access may be provided from the footway.
- Location should be overlooked (preferably from main windows) by the destination served, to deter theft or vandalism. If possible, position units by wall or hedge to avoid interfering with views from main windows.
- Units shall be securely fixed to the carriageway. Avoid units jutting out beyond line of parking into the carriageway. Units should not be removed or placed on green space.
- Where possible avoid siting near frontages of listed buildings; ideally find a non-listed building in the same street or a building obscured by a front wall/hedge.

Benefits

- Provides secure and dry cycle parking for users. Suitable for long term cycle parking.
- Can be installed on carriageway or in designated areas to avoid obstructing footways.
- Can accommodate larger cycle types.
- Can be combined with other infrastructure such as on-street bin stores to make more efficient use of allocated road space.

Drawbacks

- Can have a large footprint per cycle.
- Could be subject to vandalism or inappropriate use. Require management and maintenance.
- Cannot be placed on private land. TROs may be required when locating on carriageway.

Suitable for

Long stay cycle parking on carriageway

Residential areas

Non-residential areas

Not permitted for

Short stay cycle parking on footways

On new streets and/or any adopted areas within new developments

Hinge Top Units – Layouts

It is preferred that two hinge top units are provided at each location.

The preferred layout is face to face 'hub-style', as long as a gap of 2 metres between units is provided.

If face to face is not possible, access to the units may be provided from the footway, providing the following minimum footway widths similar to Sheffield stands in page 24 are maintained. **Minimum clear footway width** should be **3m** on high streets, neighbourhood shopping streets and strategic streets; **2.5m** on employment streets, high density residential streets and secondary streets; and **2m** on other streets.

If clear footway width cannot be not maintained, access to the unit from the carriageway may be acceptable but only in exceptional circumstances, where road safety has been carefully considered.

Access from the footway – standard layout

'Hub style' (face to face) – standard layout

Standalone Storage Units

DWG Ref: 5145925-CP-DR-C-0002

DWG Ref: 5145925-CP-DR-C-0002

Key requirements and considerations

- Large enough to accommodate demand.
- Can be accommodated within the main dwelling, such as in the porch or as a unit in the garden. Note additional permissions may be required in front gardens, particularly for listed buildings or in conservation areas.
- All facilities should be lockable.
- Green roofs should be considered as part of the development's sustainable rainwater management strategy.
- At least 20% of cycle parking, particularly in new developments, should be able to accommodate non-standard bikes, such as adapted bikes, tandems, cargo bikes and bike trailers.
- Could include two tier parking in certain situations (see pg 32 for details).

Benefits

- Secure, long term storage of cycles.
- Convenient, off-street location for users.
- Potential for multiple bicycle storage.
- Reduces on-street storage, so reduces clutter.
- May also be used for storing mobility scooters, scooters and trailers.

Drawbacks

- Large units, so only suitable where there is space to include them (i.e. more suited in new developments).
- Relatively expensive to construct.

Suitable for

Off-street long stay parking
Residential developments
Offices

Large standalone storage unit with green roof

Cycle parking at the University of Edinburgh
([Google Maps](#), 2016)

Not permitted for

Short stay parking on footways
On new streets and/or any adopted areas within new developments

Standalone Storage Units – Layout for Larger Units

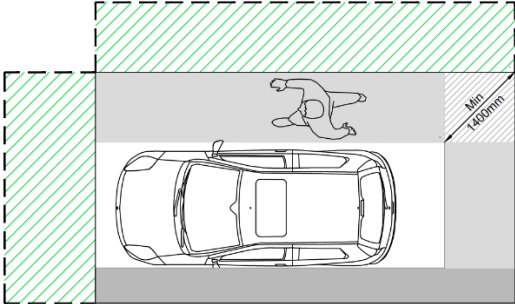

The diagram below is provided as a guide for a larger standalone storage unit, with the required dimensions to sufficiently store 50 bikes on Sheffield stands and 10 non-standard bikes on custom Sheffield stands.

Alternative or bespoke proposals need to meet the considerations discussed in the previous pages.

DWG Ref: 5145925-CP-DR-C-0001 P 02

Storage Cages

Cages within communal area assigned to individual dwellings

Cycle parking guide for new residential developments (2010), Cambridge Council

Key requirements and considerations

- Should be convenient and attractive to encourage use.
- Inappropriate placement can see bikes left in public areas with less security and negative impact on the public realm.

Benefits

- Secure, long term storage of cycles.
- Convenient, off-street location for users.
- Potential for multiple bicycle storage.
- Reduces on-street storage, so reduces clutter.
- Can be retrofitted into existing spaces and buildings.

Drawbacks

- Large units, so only suitable where there is building space to include them.

Suitable for

Off-street locations
Residential developments
Offices

Not preferred for

On-street locations

Two Tier Storage

Example of two tier storage

Atkins

Edinburgh University bike storage,
Emma Crowther

Key requirements and considerations

- Should be provided along with more lower level cycle parking facilities to cater for users who may have difficulty with the two tier system.
- Due to the future maintenance requirement of two tier racks relative to Sheffield stands, for new developments providing <50 storage spaces, these should all be provided as single-storey Sheffield stands. Where >50 bikes on Sheffield stands are required, at least 50% of the capacity should be met by single storey racks.
- Two tier racks should only be used in combination with other cycle parking types. No more than a maximum of 50% of cycle parking at a location should be two tier storage.
- Instructions on their safe operation should be visible to all users.
- Clear space for the cycle to be wheeled (rather than lifted) onto the ramp.
- Reasonable horizontal and vertical spacing to allow access for locating and locking cycles easily.
- Should be in line with [Cycling by Design](#) standards stated in section 6.2.

Benefits

- High density storage.
- Enables secure, long term storage.

Drawbacks

- Not as secure as lockers or cages.
- More difficult for users to operate.
- Often not suitable for non-standard cycles.

Suitable for

Off-street
long stay cycle
parking

Areas of high
demand

Transport
interchanges

Constrained space
locations

Not preferred for

Short stay cycle
parking on street

Retail establishments

Portable Rack Units for assessing cycle parking demand

Car shaped cycle racks

Malmo, Nazan Kocak

Portable cycle racks for assessing demand

Katowice, Nazan Kocak

Key requirements and considerations

- When located on carriageways, experimental TRO can be used to assess cycle parking demand at locations.
- 0.45m minimum clear width should be provided between any part of parked cycle and carriageway.
- Minimum clear width should be provided between any part of parked cycle and rear of footway (see Sheffield Stands page 24 for required widths).
- The colour should be sympathetic to local environment, usually black or stainless steel.

Benefits

- Offers a visual demonstration of cycling efficiencies over driving.
- High capacity single units.
- Can be used to respond to short term spikes in demand – festivals, events, seasonal demand, etc.
- Experimental TRO can be used for their temporary installations.
- Easy to move or relocate.
- Straightforward for users.

Drawbacks

- TRO is needed for permanent installation.
- The units may require more space than other options and lack flexibility of shape.
- The units are less secure if they are not cored into the ground.
- The size and aesthetic of the units may make them inappropriate in visually sensitive areas such as the World Heritage Site.

Suitable for

Short stay cycle parking:

- On carriageway

High demand locations

Short term demand (e.g. festivals)

Locations with space

Long stay cycle parking to assess demand:

- On carriageway in shopping and employment streets

Not preferred for

Locations with limited space

Wall Bars and Loops

Key requirements and considerations

- Made from brushed stainless steel or match the street furniture standards.
- Suitable if property owner owns the building but not the land around it.
- Specific consent is required for use on protected buildings.
- **Minimum clear footway width** should be **3m** on high streets, neighbourhood shopping streets and strategic streets; **2.5m** on employment streets, high density residential streets and secondary streets; and **2m** on other streets.
- Wall Bars (and Loops) will be installed at 0.75m height to avoid confusion with pedestrian handrails.
- should not be installed in locations where pedestrian handrails may be required
- should not obstruct possible desire line of a blind or partially sighted pedestrian

Benefits

- Makes use of existing streetscape.
- Low cost and easy to install.

Drawbacks

- Less secure if it doesn't allow both cycle wheel and frame to be locked together
- May not be suitable for non-standard cycles.
- Can increase street clutter.
- Can be unsightly if installed inappropriately, especially on historic buildings. [Listed building consent](#) will be required for extensions or additions to listed buildings. Planning permission may also be required, depending on the proposal. It is strongly advised that specialist advice be sought prior to carrying out any works to a listed building.
- Only appropriate for short term storage.

Suitable for

Short stay cycle parking on footway

Not suitable for

Long stay cycle parking

New Developments unless they are part of the building design and kept within the building line

Wall bars in front of a shop

Nazan Kocak

Cycle Parking Hoops on Poles

Cycle Parking Hoop

The City of Edinburgh Council

Single sided hoop layout

Double sided hoop layout

Key requirements and considerations

The key requirements and considerations for this option are:

- The colour should match the street furniture standards, in general powder coated black is preferred for cycle hoops.
- The hoop diameter should be circa 0.4m.
- The fixing for signage poles should have a diameter of 0.76m.
- The hoops should be fitted to existing sign posts and bollards. Appropriate permission must be gained from CEC before installing hoops on existing infrastructure.
- The fixing should be cylindrical and be fixed with secure or shearing nuts.
- Cycle hoops can be provided in a single or double sided arrangement.
- A 0.45m x 1.8m footprint should be allowed for per cycle.
- **Minimum clear footway width** should be **3m** on high streets, neighbourhood shopping streets and strategic streets; **2.5m** on employment streets, high density residential streets and secondary streets; and **2m** on other streets.
- Minimum clearance of 0.45m should be provided to the edge of the kerb from the front of the cycle footprint.
- Places where on street car parking is allowed, single sided hoops should be used.
- They should not be installed adjacent to designated disabled bays.

Benefits

- Easy, quick and inexpensive to install.
- Makes use of existing street furniture.
- Less visually intrusive design.

Drawbacks

- Can increase street clutter if there is a high concentration of cycle hoops.
- Inappropriate installation can damage existing infrastructure.
- Less secure.
- Not appropriate for long term parking.

Suitable for

Short stay parking

Visually sensitive areas because hoops are less intrusive within the streetscape

Not suitable for

Long stay cycle parking

Non-standard cycles

New Developments

Unsuitable Cycle Parking Examples

The Council will not approve non-standard units, layouts or sittings of cycle parking when they are retro-fitted on existing streets or provided in new developments if they are deemed as not fit-for-purpose and/or comply with the requirements of this factsheet. Some of such examples are illustrated here.
